# 1978 YEARBOOK

## Developing Computational Skills

A very timely yearbook . . . because of the renewed emphasis on **basic skills** and the public concern for the achievement of computational skills.

Mathematics includes far more than computation—but numbers and operations with numbers form the basis of many mathematics programs. To be mathematically competent in an increasingly technological world, students must have the ability to compute as well as the ability to determine what computations to perform. Read how you can help develop these skills—from the very young students to those getting ready for a career.

This is a book for teachers written by teachers. Discover a wealth of suggestions, insight, and practical considerations! Clothbound, 256 pp.

## NCTM YEARBOOK SERIES

# NCTM Yearbook on **ORGANIZING FOR MATHEMATICS INSTRUCTION**

edited by F. Joe Crosswhite

**Here's a book that will be your key to new vistas! Read it and gather a multitude of ideas for teaching approaches—see how you can individualize inexpensively in your classroom, how you can centralize learning activities in a mathematics resource area, how you can form a learning cooperative. . . how you can ORGANIZE for teaching mathematics effectively!**

This 256-page hardcover features 12 thematic essays that analyze and interpret organizational alternatives for teaching mathematics in the elementary and the secondary schools. Authors have written from their own personal experiences. Each advocates a specific teaching model that he or she believes is viable and effective—it could be just what you need in your classroom or school. Some of the essay titles are

**Organizing for Individualization: A Classroom Model**

**Organizing Independent Learning Units**

**Organizing a Learning Cooperative: Survival Groups**

**Organizing for Mastery Learning: A Group-based Approach**

**Organizing for Alternative Schools: An Integrated Approach**

**The Teacher-centered Classroom**

Also read the bonus nonthematic essay, "Hand-held Calculators: Past, Present, and Future." There couldn't be a timelier topic than this, the potential impact of the minicalculator on mathematics education.
